ABSTRACT

This review describes the phytoplankton species in the Egyptian waters of the Red Sea and some surrounding habitats namely; Gulf of Suez, Aqaba Gulf and Suez Canal as well as the species abundance during the period from 1990 to 2010.

Although many reviews on the phytoplankton species had been done for some areas of the world, a clear and concise list of the phytoplankton species for Red Sea waters (Egypt) has recently not documented.

Aim of this Review: This review aims to provide a checklist of phytoplankton species found as their names and abundance appear in the cited literature, as well as their current valid, accepted names and their common synonyms. This will allow for a better understanding of the presumed phytoplankton species documented around the areas of Red Sea waters (Egypt).

Place and Duration of Study: The phytoplankton species reported in this review are collected from the different published sources that represent the years spanning 1990-2010.

Keywords: Review; phytoplankton species; Egyptian waters; red sea.

1. INTRODUCTION

The Red Sea is a narrow inland sea separating the Arabian Peninsula, western Asia, from northeastern Africa. It extends northwest from the strait of Bab El-Mandeb to Suez, Egypt, for a distance of 1,900 km (1,200 mile). The maximum depth of the sea is 3,040 m (9,970 ft), and its maximum width is 350 km (220 mile). The northern extremity is divided by the Sinai Peninsula into the Gulfs of Suez and Aqaba. The Suez Canal connects the Red Sea with the Mediterranean Sea and Bab El-Mandeb with the Gulf of Aden, an arm of the Arabian Sea. Its ports are presented by Jeddah of Saudi Arabia, Mukalla of Yemen and Suez located at the Gulf of Suez, which are important for the traffic of the Red Sea [1,2].

The phytoplankton of the northern part of Suez Canal was studied by Dorgham [3]. El-Sherif and Ibrahim [4] studied the phytoplankton production along Suez Canal and they recorded about 139 species represented by three groups (94 Bacillariophyceae, 36 Dinophyceae and five Cyanophytes). Also, a total of 116 taxa were identified in the Bitter Lakes and Temsah Lake of Suez Canal by Nassar and Shams El-Din [5], among which 72 taxa of diatoms, 16 dinoflagellates, 14 Chlorophytes, 11 Cyanophytes, two Euglenophytes and one silicoflagellate species.

The effect of heavy petroleum hydrocarbons (aromatic derivatives), in addition to some ecological factors, on the distribution of phytoplankton in the northern part of Suez Gulf was studied by Nassar [6]. He concluded that, phytoplankton was comprised mainly of 49 diatoms (89.29 %), 18 Dinoflagellates (9.9 %), five Cyanophytes (0.68 %), three species of Chlorophytes (0.04 %) and one rarely species of silicoflagellates.

The distribution of plankton at different stations in the Red Sea (Taba, Sharm El- Sheikh, Al-Ghardaqa and Safaga) was conducted by El-Sherif and Abo El-Ezz [7]. They concluded that, one hundred and six species of phytoplankton were recorded including 41 diatoms, 53 dinoflagellates, 10 cyanophytes and two chlorophytes.

Nassar [8] found that, the phytoplankton community structure in the coastal water of Suez Gulf was mainly composed of Bacillariophyceae (47 species), Dinophyceae (18 species), Cyanophyceae (4 species) and Chrysophyceae (one species).

The phytoplankton standing crop and species composition in Suez Bay were studied by Nassar and Hamed [9]. They concluded that, a total of 80 species and varieties were identified at the selected stations of the Bay.

The seasonal variations of phytoplankton distribution and abundance in relation to the environmental conditions and human impacts are estimated in the Suez Canal, Suez Gulf and the northern part of the Red Sea, Egypt by Deyab et al. [10]. They observed that, a total of 200 species of phytoplankton belonging to 45 different genera were recorded.

Nassar [11] studied the phytoplankton abundance and species composition in the coastal waters of Suez Gulf. The results indicated 144 species of phytoplankton were observed and classified as 89 diatoms (70.3%), 30 dinoflagellates (6.13%), 12 chlorophytes (18.4%), 12 cyanophytes (5.14%) and one silicoflagellate species. Also, Nassar [12] estimated the seasonal fluctuations of phytoplankton in the coastal waters of the Aqaba Gulf. The phytoplankton abundance included 127 species of phytoplankton, which distributed as; 75 diatoms, 27 dinoflagellates, 16 cyanophytes, eight chlorophytes as well as one silicoflagellate species.

Madkour et al. [13] studied the phytoplankton population along the Egyptian coastal regions of the Red Sea. The phytoplankton abundance was fairly diversified (181 species) and comprised mainly two groups; dinoflagellates (116 species) and diatoms (60 species).

However, there are many published and un-published data about the phytoplankton distribution in the Egyptian Red Sea water, but they scattered and not updated.

The present study aims to collect these data in terms of species composition during the period, 1990-2010, and the reported species are documented, including: 1) the species name listed as it is appeared in the original publications; 2) the species current, valid and accepted names; and, 3) the common synonyms, verified through the taxonomic database sites; algaebase.com (ab), World Register of Marine Species (WoRMS), Canadian Register of Marine Species (CaRMS), Nordic Microalgae and Aquatic Protozoa (NOD) and Integrated Taxonomic Information System (ITIS).

2. METHODS

Phytoplankton standing crop was determined in the represented papers by sedimentation technique as described by Ütermohl [14] and its magnitude is expressed in units per liter. For identification of the algal taxa, the following references were consulted; Peragallo and Peragallo [15], Ghazzawi [16], Cupp [17], Bourrelly [18] and Bold and Wynne [19] for the diatoms and silicoflagellates. Ferguson Wood [20] for dinoflagellates. El-Nayal [21], Huber-Pestaluzzi [22] and Prescott [23] for cyanophytes. Stewart and Mattox [24] for chlorophytes as well as Sourina [25] and Mizuno [26] for identification of different classes of phytoplankton.

3. RESULTS

The phytoplankton data reported in this review are collected from the different published sources that represent the years spanning 1990-2010. The study areas including the Gulfs of Suez and Aqaba [SG and AG], Suez Canal [SC] and the Egyptian waters of the Red Sea [RS].

Generally, the collected phytoplankton data were represented by about 207 phytoplankton species recorded in the Egyptian waters of the Red Sea and the studied surrounding habitats. These species are classified as; 45 genus of Bacillariophyceae (116 species), 15 genera (48 species) of Dinophyceae, 11 genera (20 species) of Chlorophyceae, nine genera (19 species) of Cyanobacteria (Cyanophyceae), two genera (three species) of Euglenophyceae as well as one species of Chrysophyceae (Appendix 1).

4. CONCLUSION

There are many un-accepted names of the phytoplankton species that previously recorded in the published literatures in the Egyptian waters of the Res Sea as well as some surrounding habitats during the period 1990-2010, so this review describes these species as their names and abundance as presented in the cited literatures, as well as their current, valid, accepted names and their common synonyms according to some taxonomic algal database sites.
